Introduction

- Early recognition and rapid transport to a stroke center by prehospital providers are essential in the care of stroke patients.
- We trained prehospital providers to perform the Miami Emergency Neurological Deficit (MEND) exam as part of an 8-hour comprehensive course, Advanced Stroke Life Support (ASLS)®.
- The MEND exam incorporates all three components of the Cincinnati Prehospital Stroke Scale (CPSS) (speech, droop, drift) and eight additional components from the NIHSS:
  - Level of consciousness
  - Gaze
  - Orientation
  - Leg motor strength
  - Commands
  - Limb ataxia
  - Visual fields
  - Sensation
- The MEND can provide an expanded baseline exam in the prehospital setting without delaying scene times.
- Additionally, the exam can be used as an initial evaluation tool by nurses and for subsequent exams in the ED, ICU or floor.

Purpose

- To determine the correlation of the MEND exam completed in the prehospital setting to the initial NIHSS performed by a neurologist at the receiving facility.
- All prehospital providers from three fire rescue departments in Monroe County participated in the 8-hour ASLS® course and stroke protocol training.
- We trained a total of 169 first responders (96 EMT-Ps, 68 EMTs, 5 RNs).
- The prehospital providers conducted the CPSS on scene, and if abnormal, placed the helicopter team on standby.
- Providers then performed the MEND exam and relayed findings to the stroke neurologist at the receiving facility.
- Patients meeting air transport criteria (Fig. 1) were flown from the scene to the receiving hospital.
- We conducted a retrospective review of the MEND exam performed by the prehospital providers.
- We then correlated these results to the same components of the initial NIHSS performed by the neurologist at the receiving hospital.
- Additionally, we reviewed the final discharge diagnosis to determine whether the patient had a stroke or TIA versus other diagnosis.

Methods

- We trained a total of 169 first responders (96 EMT-Ps, 68 EMTs, 5 RNs).
- The prehospital providers conducted the CPSS on scene, and if abnormal, placed the helicopter team on standby.
- Providers then performed the MEND exam and relayed findings to the stroke neurologist at the receiving facility.
- Patients meeting air transport criteria (Fig. 1) were flown from the scene to the receiving hospital.
- We conducted a retrospective review of the MEND exam performed by the prehospital providers.
- We then correlated these results to the same components of the initial NIHSS performed by the neurologist at the receiving hospital.
- Additionally, we reviewed the final discharge diagnosis to determine whether the patient had a stroke or TIA versus other diagnosis.

Monroe County Fire Rescue Prehospital Stroke Program

- From September 2008 to June 2011, 51 airlifted patients met the criteria for undergoing both a MEND exam and the NIHSS.
- There were 32 males (63%) and 19 females (37%), with a median age of 67 years (44-98 years).
- The MEND exam performed on scene by paramedics correlated with the initial NIHSS performed in the hospital by the stroke team in 46 of the 51 (90.2%) patients. Details of the five patients whose exams did not correlate are provided in Fig. 4.
- The average NIHSS score was 9 with a range from 0 to 30.
- A total of 40 patients (78.4%) were diagnosed with stroke (37) or TIA (3). Of the 37 strokes, 32 were ischemic (86.5%) and 5 hemorrhagic (13.5%).
- The 11 patients who were not diagnosed with TIA or stroke had several different conditions including seizure (in settings of old L MCA hemorrhage and Bell’s Palsy), hypertensive crisis, viral encephalitis, and complex migraine. Noticeably, seven of these patients had NIHSS scores that correlated with paramedic findings on the MEND exam on scene. Therefore, the paramedics were correct in activating the stroke alert protocol in these patients.

Results

- The MEND exam completed on scene by paramedics correlated well with the same components on the initial NIHSS performed by the neurologist at the receiving hospital.
- The MEND exam is a valuable tool when assessing stroke patients in the field and determining the need for air transport.

Conclusions

- The MEND exam completed on scene by paramedics correlated well with the same components on the initial NIHSS performed by the neurologist at the receiving hospital.
